ABSTRACT

Background: The success of any program is measured by continuous monitoring through service statistics for a periodic oversight and through evaluation surveys to measure the relevance, effectiveness, efficiency and impact of activities in the light of specified objectives. Service statistics need a lot of indicators to be tracked on a regular basis. The service statistics provide us with numerators. To understand the numerators more meaningfully, we need to standardize them by using specific denominators. So, denominators have to be estimated, which can enable computation of indicators for monitoring purposes. Census and Large scale sample surveys provide proportions to calculate denominators for program monitoring purposes.

Methods: This paper uses demographic techniques to estimate denominators for all the countries for which data from the world population prospects is available.

Results: The denominators have been estimated for number of infants, children and women of reproductive age and elderly in the age group of 60+ years.

Conclusions: The estimations of denominators at the sub-national levels becomes quite challenging due to the scarce availability of data to be used as proportions for different population groups. But, once, the methodology is improved with appropriate data, it could serve as a boon for annual program monitoring process at multiple data time points between two national surveys.

Keywords: Demographic techniques, Estimation of denominators, Program planning and monitoring

INTRODUCTION

Program monitoring and evaluations are the means to understand a program. Program evaluation is periodic, while program monitoring is continuous. For program monitoring, there is a need to have data on the population group, which is the target audience for receiving the program. This is usually available through population censuses, which with quinquennial or decadal. But, during the inter-censal period, there is a need to obtain data on denominators for monitoring the program to

enable effective course corrections to achieve the program objective, outputs and outcomes. This is an attempt to devise a methodology to arrive at these denominators for program monitoring. The availability of denominators on a regular basis is a necessity for programmatic purposes. This is usually available through population censuses, which with quinquennial or decadal. Censuses are quite expensive and are conducted non-annually at an interval of five or ten years. So, there is a need to project population at national as well as sub-national levels and estimate age specific denominators

during the inter-censal period. Though there have been methods to estimate denominators at national and sub-national levels. There is still an unmet need to have a standardized method of estimation of denominators. This paper uses demographic techniques to estimate denominators for all the countries in the world. This paper uses the methodology proposed in the paper by Raut et al and applies it to the 199 countries around the world as per the UN population projections for the year 2017 revision.¹

Objectives

The objective of the study is to estimate the proportions for different age-specific population groups for use in program monitoring and for the purposes of forecasting of supplies of iron and folic acid tablets, vitamin A capsules, vaccines etc.

METHODS

This paper uses demographic techniques to estimate denominators for all the 199 countries. The age wise proportions have been computed from the population estimates of the world population prospects, 2017 revision.²⁻⁵ In this paper, we have tried to estimate the denominators for all these groups for the purpose of monitoring, which may be used at sub-national levels, when no population proportions are available, with some assumptions. All the computations have been carried out in Microsoft Excel 2013. The methodology of estimation of population proportions of different groups is mentioned in the following table.

Table 1: Estimation of age-specific population denominators.

Age group	Population denominators for monitoring of the following interventions / micronutrients supplementation	Formula
Children under five years		
Infants 0 to 5* months ^{6, 7}	Exclusive breastfeeding among 0 to 5 months infants	(Children 0 to 59 months) * (1/59 months*6 months)
Infants 0 to 11* months	Immunization	(Children 0 to 59 months) * (1/59 months*47 months)
Infants 6 to 8* months	Initiation of complementary feeding	(Children 0 to 59 months)- (Infants 0 to 5 months)- (Infants/ Children 9 to 59 months)
Infants 6 to 11* months	Vitamin A supplementation + Initiation of complementary feeding during 6 to 8 months	(Children 6 to 59 months)- (Children 12 to 59 months)
Children 12 to 23* months	Infant and young child nutrition (IYCN)	(Children 0 to 59 months)- (Infants 0 to 11 months- children 24 to 59 months)
Children 0 to 23* months ^{6, 7}	Infant and young child nutrition (IYCN)	(Children 0 to 59 months)- (1/59*23 months)
Children 6 to 23* months ^{6, 7}	Infant and young child nutrition (IYCN) + Multiple micronutrient powder (MNP)	(Children 0 to 5 months)+(children 12 to 23 months)
Children 6 to 59* months	Vitamin A supplementation + Iron & Folic acid supplementation + zinc and ORS for diarrhoea management	(Children 0 to 59 months) * (1/59 months*53 months)
Children 9 to 59* months	Vitamin A supplementation	(Children 0 to 59 months) * (1/59 months*50 months)
Children 12 to 59* months	Vitamin A supplementation	(Children 0 to 59 months) * (1/59 months*47 months)
Children 0 to 59 months	Vitamin A supplementation + Iron & Folic acid supplementation + zinc and ORS for diarrhoea management	Available from census and estimates (population of 0 to 4 years)

Source: World Health Organization, UNICEF, IFPRI, University of UC Davis, FANTA 2, AED, USAID, (2010). Indicators for assessing infant and young child feeding practices: Part 1 : Definitions: Conclusions of a consensus meeting held 6–8 November 2007 in Washington D.C., USA. World Health Organization, UNICEF, IFPRI, University of UC Davis, FANTA 2, AED, USAID, (2010). Indicators for assessing infant and young child feeding practices: Part 2 : Measurement: Conclusions of a consensus meeting held 6–8 November 2007 in Washington D.C., USA. *: Under the assumption that the proportion of population at each month is uniformly distributed within 0 to 59 months age group, which may or may not be applicable everywhere.

RESULTS

Estimated population in different age groups from 0 years to senility in 2018: The population of under-five children (0 to 4 years of age) varied from as low as 4% to

20% among the countries around the world. The per cent of elderly (60+ years) varied from 3% to 34% among the countries around the globe (Table 2).

Table 2: Age-specific population 0 to 60+ years of age per 100 and per 1,000 population in countries around the world, 2018.

Estimated number of children under five years of age in 2018

The per cent of infants in the age group of 0 to 5 months varied from 0.4% to 2.1% around the globe and infants 0 to 11 months varied from 0.8% to 4.1%. The per cent of infants/ children 6 to 23 months varied from 1.2% to 6.2%. The per cent of children 6 to 59 months varied from 3.6% to 18.2% (Table 3).

DISCUSSION

Denominator estimation is carried out for program monitoring but detailed guidance on it is relatively rare in the literature. So, it is an attempt to standardize the process of denominator estimation, which could facilitate the process of program planning, budgeting and monitoring of program performance. Though denominator estimations are a regular part of monitoring of any program, it needs a lot of standardization. This is an attempt at standardizing this methodology in all the countries of the world. These denominators could also be useful for estimation of requirement for different health products, micronutrients and health services at the grassroots level at a cluster of about two hundred households or about a thousand population, assuming a mean household size of five persons per household. The time periods considered here are based on the following references and assumptions: The calculation of month has been considered here as 30 days based on the sidereal year (the orbital period of the earth around the sun, taking the stars as a reference frame) of 365.25 days or 365 days and 6 hours, which comes to $365.25 \text{ days} / 12 \text{ months} = 30.4375 \text{ days}$ rounded off to 30 days in a month. The neonatal period is considered from birth through 27 days, 23 hours, 59 minutes, while the Post Neonatal period is considered from the end of 28th day through 364 days and the infant period is considered as 364 days, 23 hours, 59 minutes from the moment of birth. The World Health Organization (WHO) defines adolescents as those people between 10 and 19 years of age.

CONCLUSION

Denominator estimation for program monitoring at regular intervals is a veritable necessity at every level of health system to obtain the pulse of the program, facilitating the path towards effective course correction. In order to obtain more realistic estimates at the different administrative levels, it is recommended to undertake this computation at sub-national levels, which could facilitate program planning and monitoring at sub-national levels and used for program course corrections to achieve the goals of SDGs.
