

BACKGROUND

The interrelated crises of the COVID-19 pandemic, climate change and cost of living have put unprecedented pressure on social sector accounts and caused governments to consider diverting investments in public health and prevention programs to bolster short term responses to urgent needs.

In 2012, the World Health Assembly (WHA) set global nutrition targets to spur action and investment for addressing malnutrition. In May 2025, the targets were revaluated, reset and extended to 2030. The 2030 targets aim to achieve a 40% reduction in the number of children under five who are stunted, a 50% reduction of anaemia prevalence in women of reproductive age, a 30% reduction of low birthweight among newborns and an increase in the rate of exclusive breastfeeding to 60% in the first six months. Targets have also been set on overweight and obesity, and on wasting¹. At present, most Association of Southeast Asian Nations (ASEAN) member countries are off course to meet these targets.

In the ASEAN region, more than 14 million children under five are stunted, 15 million are anaemic, 1.4 million are born with low birthweight and close to six million are being sub-optimally breastfed. Additionally, more than 47 million older² adolescent girls and women (15-49 years) suffer from anaemia².

Through the development of an online, user-friendly Cost of Inaction Tool, Nutrition International has sought to support policy makers as they assess their nutrition programs weigh their options. The tool provides an analysis of the costs of "inaction" – of allowing limited to no progress on key indicators of undernutrition and how such inaction doing so affects countries' income in both the immediate and long term. In short, the new tool demonstrates that inaction on malnutrition comes at a significant price – one that can be averted through investments in proven, cost-effective, high-impact nutrition interventions.

THE FINDINGS

The impacts of poor nutrition are wide-ranging and serious. Findings from the Cost of Inaction Tool estimate that the total global economic cost of undernutrition is more than USD \$761 billion per year. In ASEAN, at least USD \$65 billion per year could be saved with increased investments in stunting, anaemia in children, anaemia in adolescent girls and women of reproductive age, low birthweight, and the protection, promotion and support for breastfeeding.^{3,4}

When a population is undernourished, it is more vulnerable to preventable infections and diseases. With adequate nutrition, not only does a population strengthen immune systems, but healthcare costs and treatment expenses are also reduced. Ensuring proper nutrition for vulnerable groups, such as infants, young children and pregnant women is key to unlocking their potential. When children are well-nourished, they are more likely to succeed in school, which in turn helps them to live a better life, thrive and contribute to socio-economic development.

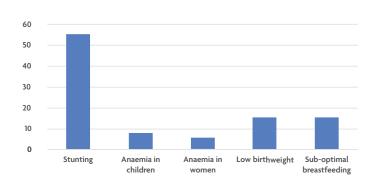

KEY FINDINGS

Each year, in ASEAN countries, the current levels of stunting, low birthweight, anaemia, and not protecting, promoting, and supporting breastfeeding result in an estimated:

- 60,000 child deaths
- 31 million IQ points lost
- 11,000 maternal deaths from cancers and type II diabetes
- 5 million school years lost
- USD \$65 billion
 in economic costs (or 2.3% of the gross national income) due to cognitive and mortality losses

Exclusive breastfeeding prevalence data is unavailable for Brunei Darussalam and Singapore; this estimate reflects data from the remaining eight ASEAN countries

ECONOMIC COST OF INACTION IN ASEAN, USD \$ BILLION PER YEAR

ASEAN MEMBER COUNTRIES

The tables on the following pages present the annual health and economic costs of stunting, anaemia, low birthweight, and not supporting, protecting and promoting breastfeeding in 10 ASEAN countries.

The costs are calculated based on current prevalence levels as well as the WHA target prevalence levels for comparison of the potential health and economic gains. For anaemia in children, a 50% reduction in prevalence is assumed, mirroring the WHA target for anaemia in women. The methods, data sources and estimates for additional indicators are available for over 140 countries around through Nutrition International's online Cost of Inaction⁵ and Cost of Not Breastfeeding⁶ tools.

ABOUT NUTRITION INTERNATIONAL TOOLS

The Nutrition International Cost of Inaction Tool was released in 2024 by Nutrition International, in partnership with Limestone Analytics and with funding from the Government of Canada. The Cost of Not Breastfeeding Tool was created in 2017 by Alive & Thrive, with funding from the Gates Foundation, and it was updated by Nutrition International and Alive & Thrive in partnership with Limestone Analytics in 2022, with funding from Government of Canada. Both tools present results for over 140 countries using standardized data from global health and development agencies including WHO, UNICEF, and the World Bank to see the potential benefits if action is taken now. All estimates included in this brief are as of June 2025. Visit both tools on Nutrition International's website to read about the methodology and data sources and to learn more about Nutrition International.

For further support, including additional analyses, tool demonstrations and technical assistance, you can reach out to Nutrition International at healthecon@NutritionIntl.org.
